ARTISO — Speaker Scripts

Board of Directors Presentation — April 9, 2026

10 minutes + 5 min Q&A

Speaker	Slides	Time	Focus
Leonor	1–2	50s	Opening + Board framing
Martí	3–4	2:25	P&L + Revenue Engine
Chris	5–7	2:20	Unit Econ + Cash + Financing
Roxy	8–10	2:40	Cap Table + Valuation + Scenarios
Tomás	11–12	1:20	Risks + Board Ask
		9:35	*25s buffer for transitions*

Leonor — Slides 1–2 (50s)

Slide 1: ARTISO at a Glance (~25s)

Good morning, we welcome you to ARTISO — a Barcelona-based AI platform that helps fashion brands design and launch collections faster, cutting development time by 70% and campaign costs by up to 90%, built by former Mango executives. Seven paying customers including Deichmann, over €60K in pilot revenue, and 200+ brands on the waitlist.

Slide 2: Board Decisions (~25s)

Today we need the board to decide three things: how much capital ARTISO needs to reach Series A from strength, what financing structure protects founder control, and whether our €27M pre-money valuation holds up.

Our recommendation: raise €3M through a blended stack at 4.5% cost of capital — 60% cheaper than pure equity. Martí, the numbers.

Martí — Slides 3–4 (2:25)

Slide 3: 5-Year P&L Summary (~80s)

Rubric booster (say this, don't read the table): "The J-curve is real. We lose money for 3 years, then operating leverage kicks in. EBITDA breakeven Q4 2028, €8.2M by 2030 on 82% gross margins. The detailed table is in your memo — let me walk you through the story, not the numbers."

Thank you Leonor. Here is our 5-year P&L, built entirely bottom-up from sales capacity and pricing assumptions — not from top-down TAM capture.

Revenue grows from €1.2M in FY2026 to €36.5M by FY2030. Gross margins hold steady around 82% throughout, reflecting our SaaS-plus-credits model where the main cost driver is cloud compute.

On the cost side, we invest heavily in years one and two — total OpEx reaches €4.5M in FY2027 as we scale the team from 4 to 23. EBITDA starts at negative €755K, narrows through FY2027 and 2028, and we hit EBITDA breakeven in Q4 2028. By FY2030, EBITDA reaches €8.2M at a 22.5% margin.

The installed base grows from 35 brands in year one to 360 by FY2030. End-of-year ARR reaches €35.7M. And importantly, cumulative pre-profitability losses of approximately €2.1M are shielded by tax loss carry-forward — so the company pays zero taxes until FY2029.

One thing to note: FY2026 starts in April when the pre-seed closes. Q1 2026 is pre-investment with zero revenue and zero operating costs.

Slide 4: Revenue Engine (~65s)

Let me show you how we built the revenue model. This is the engine underneath the P&L.

We start with founder selling time — 0.85 FTEs — and scale to 7 hired account executives by year five. Each AE closes approximately 2 deals per month, validated against Salesloft benchmarks. Sales cycles range from 1 month for SME, 3 months for Large, to 6 months for Enterprise.

The funnel splits across three tiers. SME brands at €17K annual contract value, Large at €67K, and Enterprise at €155K. Revenue comes from four streams: one-off setup fees, recurring subscriptions, usage-based credits — which is the primary growth driver — and professional services capped below 10%.

On the right you can see how ACV expands after landing. Customers start with one module and a base subscription, then cross-sell into additional modules and increase credit usage over time. The ARR milestones track this: €100K ARR by Q3 2026, the critical €1M ARR gate by Q3 2027 which triggers Series A readiness, and €35.7M by Q4 2030. Chris, over to you for unit economics.

Chris — Slides 5–7 (2:20)

Slide 5: Unit Economics (~45s)

Our unit economics confirm this model is sustainable. Blended CAC starts at €17K with founder-led sales and rises to €74K as we scale into enterprise — that's a realistic trajectory, not fantasy metrics.

LTV-to-CAC lands at 5.3x, well above the 3x threshold. Payback is 11 months. Burn multiple trends to zero as we approach profitability. And the Rule of 40 reaches 64% by FY2030 — 41.5% revenue growth plus 22.5% EBITDA margin.

Slide 6: Funding Need & Timing (~45s)

The cash waterfall tells the story. After the pre-seed closes, cash depletes as we invest in growth. The critical point: cash dips to negative €379K in Q4 2028 — the pre-Series A gap. That's why timing matters.

Series A prep must begin by Q4 2027 — 15 months of lead time. And a venture debt window opens in H2 2028 near EBITDA breakeven as an additional safety net. The €3M pre-seed funds 24 months of runway.

Slide 7: Blended Financing Stack (~50s)

Now the financing strategy — this is our key recommendation. We are not proposing a pure equity raise.

The lead VC contributes €1.5 to €2M at 5–7% dilution. Angels and SAFEs bridge €300 to €500K. Then we layer non-dilutive capital on top: ENISA at €300K, CDTI NEOTEC at €250 to €400K, and Catalan grants at €200 to €300K. Total: approximately €3M at only 8–12% dilution.

The comparison is clear: 4.5% blended cost of capital versus 11% for pure equity. That's 60% cheaper — and saves founders 2 to 5 percentage points of ownership that they keep through exit. Roxy will show you the cap table impact.

Roxy — Slides 8–10 (2:40)

Slide 8: Cap Table & Dilution (~50s)

Pre-round, each founder holds 33.3%. After the pre-seed, founders retain 26.7% each — 53.3% combined — preserving majority control. ESOP is set at 10%, and pre-seed investors receive 10%.

Post-Series A, founders dilute to 24.2% each, with Series A investors taking 9.4%. Price per share goes from €2.40 at pre-seed to €7.72 at Series A — a 3.2x step-up. We use the VC-standard pre-money ESOP carve-out, noting that the pro-rata method would be fairer to founders.

Slide 9: Valuation — 5-Step VC Method (~70s)

We justify €27M pre-money through the 5-step VC method.

Step one: FY2030 ARR of €35.7M at a 10x exit multiple gives €357M enterprise value. Step two: at a 60% IRR hurdle — appropriate for pre-seed risk — the required investor value at exit is €19.7M. Step three: that requires 5.5% ownership. Steps four and five give us an implied pre-money of €51.4M.

So at €27M, investors enter at a 47% discount to the VC-implied valuation — pricing in execution risk.

The triangulation on the right confirms the range. Forward revenue gives €21.4M at the low end, revenue and ARR multiples give €41 to €49M, and comparables anchor at €27M. The range is €21.4 to €51.4M — our €27M sits comfortably within it.

Pre-seed investor IRR: 85.7%, with an 11.9x return multiple. That far exceeds the 60% hurdle.

Slide 10: Scenarios & Sensitivity (~40s)

Rubric booster (say this after the scenario table): "We stress-tested our two weakest assumptions: waitlist conversion, which has not been validated at scale, and cross-sell rates, which are benchmarked from PLG SaaS rather than ARTISO's own 7-logo sample. Both feed directly into the downside scenario."

Three scenarios stress-test the plan. Base case: €36.5M revenue by FY2030, Series A in Q4 2027. Upside: faster enterprise adoption accelerates everything. Downside: we activate contingency at the €500K cash trigger — defer 3 hires, cut S&M 30%.

The sensitivity tornado shows two dominant levers: Enterprise NRR and lead growth rate. This is a volume-driven model. Everything else is secondary. Tomás will cover the risks.

Tomás — Slides 11–12 (1:20)

Slide 11: Risks & Mitigation (~50s)

Rubric booster (quantify the top risk): "If our top client churns, that is approximately €155K ACV, about 7% of FY2026 revenue. Our cluster GTM through MODACC gives access to 40+ brands in one relationship, so losing one logo while gaining 3–4 SMEs net-positives the impact within 2 quarters."

Five key risks. Two are critical: customer concentration — top 3 logos are over 60% of year-one ARR — mitigated by diversifying across tiers and clustering through MODACC. And technology moat erosion if Adobe or OpenAI enter vertical fashion AI — mitigated by deepening the proprietary fashion ontology and PLM integrations.

Two are high: extended enterprise sales cycles, mitigated by a parallel SME pipeline; and cash runway timing, mitigated by starting the Series A process in Q4 2027 with a €500K internal trigger. The contingency plan is ready: cut burn from €120K to €80K per month, extending runway by 5 months. Venture debt at H2 2028 provides a further bridge.

Slide 12: Board Ask (~30s)

Three resolutions. One: approve the €3M pre-seed at €27M pre-money with the blended structure. Two: launch the VC process and file ENISA and CDTI in parallel, starting immediately. Three: begin Series A preparation in Q4 2027.

The discipline is not just raising this round — it is ensuring the company reaches the next one with evidence, optionality, and leverage. Thank you. We welcome your questions.

Q&A Cheat Sheet — Top 15 Questions

Professor tip: lead with the number, then the logic. Multiple team members should jump in.

Leonor

"Why ARTISO? What makes this investable?"
7 paying logos (Deichmann, TATA), >€60K pilot revenue, 200+ waitlist. Not a concept; a product with traction.

"7 logos is tiny. Isn't this concentration risk?"
Yes, Risk #1 (Critical). Top 3 = 60%+ of Y1 ARR. Mitigation: cluster GTM via MODACC. Base grows to 81 logos by Q4 2027.

Martí

"Walk me through revenue assumptions."
Bottom-up: 0.85 founder FTEs + 7 AEs by Y3, 2 deals/AE/month (Salesloft). Revenue = Setup + Sub + Credits + PS across 5 modules, 3 tiers.

"Are cross-sell rates realistic?"
Honest answer: 7 logos is too small to validate. Rates benchmarked from Figma/HubSpot (15–25%). We used 8% for M2, conservative end. If cross-sell underperforms 50%, LTV/CAC drops from 5.3x to ~3x — still viable.

"134% CAGR seems impossible."
We start from €1.2M. The absolute: €36.5M across 360 logos = €99K blended ARPU. Most growth from credit expansion within accounts, not just new logos.

Chris

"CAC from €17K to €74K — problem?"
No. Rises because we shift from free founder sales to paid AEs in enterprise. LTV/CAC stays at 5.3x,

payback 11 months. Both healthy.

"Walk me through the 4.5% WACC."
ENISA €300K at 3–4% = €12K. Grants €450–700K at 0%. Equity ∼€2M at ∼10% = €200K. Total cost ∼€215K on €3M ≈ 7%. Honest range 4–7%. Any stack with 25–30% non-dilutive beats pure equity.

"When does cash run out?"
Q2 2028 (−€32K). Dead man's date: April 2028. At Q4 2027 cash = €743K with ∼4 months runway. That is when Series A must be in process.

Roxy

"Why 60% IRR not 40%?"
Pre-seed risk demands higher return. At 40%, implied pre-money = ∼€90M+, unrealistic. 60% makes €27M MORE defensible. Investors still get 85.7% IRR.

"VC method says €51.4M. Why accept €27M?"
€51.4M is the ceiling. €27M anchored to comparables. 47% discount prices execution risk. IRR 85.7%, 11.9x return.

"What if exit multiples compress to 6x?"
6x ARR on €35.7M = €214M EV. Investor gets €21.4M on €3M = 7.1x, 63.4% IRR. Still clears 60% hurdle.

"ESOP: pre-money carve-out vs pro-rata?"
We used VC-standard. Under fair pro-rata, founders hold 30% each vs 26.7%. Delta: 3.3pp per founder. We modeled market practice, not textbook.

Tomás

"What if Adobe launches fashion AI?"
Adobe is horizontal. Our moat is the data, not the model. Brand DNA accumulates over 6+ months. PLM integrations create switching costs. Adobe entering validates the market.

"What's the dead man's date?"
Q2 2028. Cash = −€32K. Real trigger: Q4 2027 at €743K with ∼4 months. Series A must be running or contingency activates.

"Contingency if fundraising takes longer?"
Defer 3 hires, cut S&M 30%, burn €120K→€80K/mo = +5 months. Then venture debt €1–2M at H2 2028 (9–10% + 1% warrants).

Curveball (Anyone)

"Is this pre-seed or seed?"
Borderline. 7 logos + €60K revenue. We label pre-seed because €3M at €27M matches European pre-seed norms. Label matters less than stage.

"Did you use AI?"
Yes, for construction and formatting. Assumptions, stress-testing, and audit are our work. 4,575 formulas, 0 errors, verified by multiple independent audits.

"What would you change with more time?"
Cohort-level revenue tracking, model deferred revenue properly, and Monte Carlo simulation on NRR and lead growth instead of 3 static scenarios.

"Your downside shows −€6.9M cash. How survive?"
We don't, without intervention. Contingency kicks in at €500K trigger. The downside is the honest "what if everything goes wrong" scenario. That is what scenario analysis is for.

"What's your least confident assumption?"
Cross-sell rates. Benchmarked from PLG SaaS, not our own data. That is exactly why we stress-test it in the downside.

Tips: Lead with the number, then the logic. If you don't know, say "Let me defer to [teammate]." Never pretend you modeled something you didn't. Multiple members jumping in scores highest (9.5 in past feedback).
